Deterministic Evaluation

Stochastic Evaluation (Transformed into Confidence Intervals)

Discrete Probabilistic Evaluation

A={
$$p_1(1, 1) = 1$$

 $p_2(3, 3) = 1$
 $p_3(6, 5) = 1$ }

B={{
$$p_4(1, 1.5) = m1*m3$$
}
 $p_4(1, 3) = m1*(1-m3)$
 $p_4(2, 1.5) = (1-m1)*m3,$
 $p_4(2, 3) = (1-m1)*(1-m3),$
 $\{p_5(2, 3) = m4*m6$
 $p_5(3, 3) = m5*m6$
 $p_5(4, 3) = (1-m4-m5)*m6$
 $p_5(2, 4) = m4*(1-m6)$
 $p_5(2, 4) = m4*(1-m6)$
 $p_5(3, 4) = m5*(1-m6)$

Fusion (PF) of multiple assignments to the same point: $PF(2,3) = p_4(2,3) + p_5(2,3) - p_4(2,3) * p_5(2,3) \\ = (1-m1)*(1-m3) + m4*m6 - [(1-m1)*(1-m3)* m4*m6$

 $PF(3,3) = p_2(3,3) + p_5(3,3) - p_2(3,3) * p_5(3,3)$ = 1+ m5*m6 - 1* m5*m6 = 1

Probabilistic Fusion

Feasible Regions for Optimization

 - VAR is a nonlinear nonconvex constraint

Objective Functions

Figure 34

Linear Function

Word Description

- mole Equation
- Market value weighted yield Duration

weighted yield

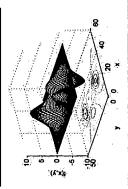

- Function is defined using linear equations
 - Straightforward math relationship
 - Easy to optimize
- f(x, y) = 2x + y + 5

 Interest rate sigma

Nonlinear Convex Function

- Function is defined using a *nonlinear* equation
- Functional gradients lead to single optimum
 - Harder to optimize
- $f(x, y) = x^2 + y^2$

Nonlinear Nonconvex Function

- Function is defined using complex nonlinear
 - Multiple local optima equations
- Functional gradients are inefficient
- Very hard to optimize

$$f(x, y) = g_1(x, y) +$$

 $g_2(x, y) + g_3(x, y) +$
 $g_4(x, y)$

sigma and VAR Interest rate

Boundary Feasible Space

σ

space (i.e. convexity), allowed us develop design efficient interior sampling methods. space, we can exploit that knowledge to algorithm (solutions archive generation) By knowing the boundary of the search Knowledge about geometry of feasible a feasible space boundary sampling

Convex crossover is a powerful interior sampling method, which is guaranteed to produce feasible $O_2 = (1 - \lambda)P_1 + \lambda P_2$. An offspring O_k and P_k can offspring solutions. Given parents P₁, P₂, it creates offspring $O_1 = \lambda P_1 + (1 - \lambda)P_2$,

crossed over to produce more diverse offspring.

Example of Outer Product using as operator the function $I(x,y)$
$T_1(x,y) = \max(0,x+y-1)$
No correlation

Example of Outer Produc	of Outer Product using as operator the function $S(x,y)$
T-conorm	Correlation Type
$S_{1} = \min(1, x + y)$	Extreme case of negative correlation
$S_2 = x + y - (x * y)$	No correlation
$S_3 = \max(x, y)$	Extreme case of positive correlation
